AI Agents as the Universal Integration Layer

Next-Generation System Interoperability

Katarzyna Starosławska

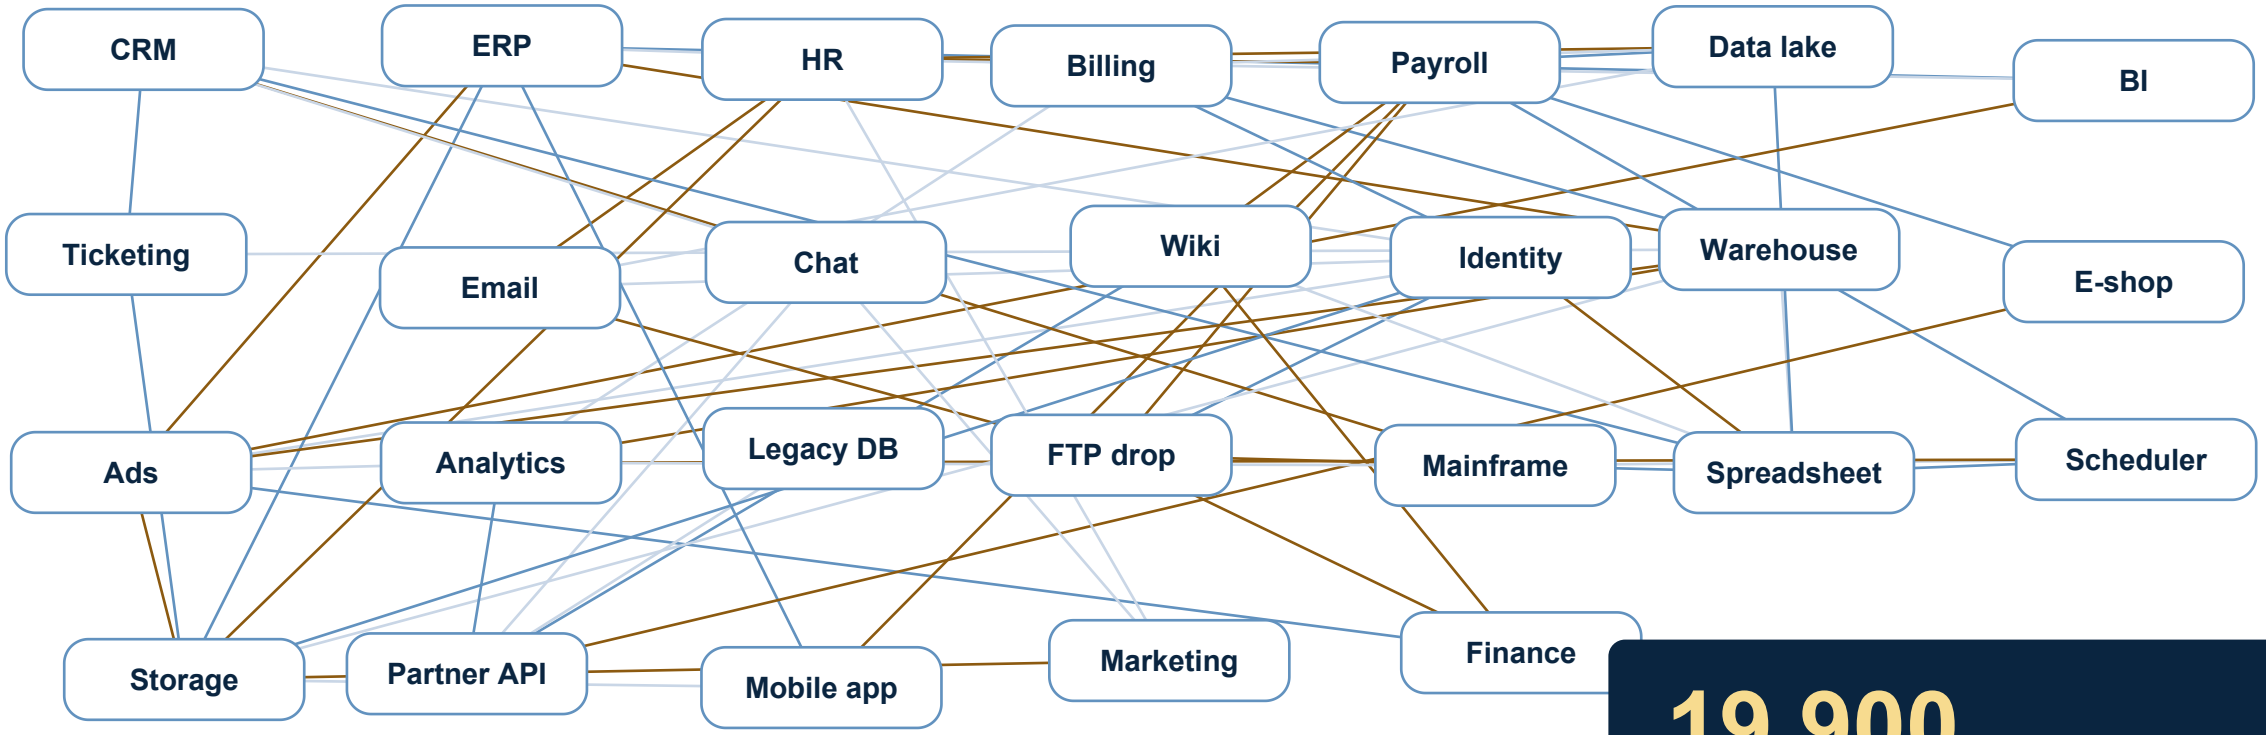

Agentic AI Summit · 16 October 2026

Millions of webs.
Impossible to tame.

This is your integration landscape today

19,900

possible point-to-point links between 200 systems

Why APIs and ESBs are straining

Fixed.

Design-time binding: decided before it runs

Brittle.

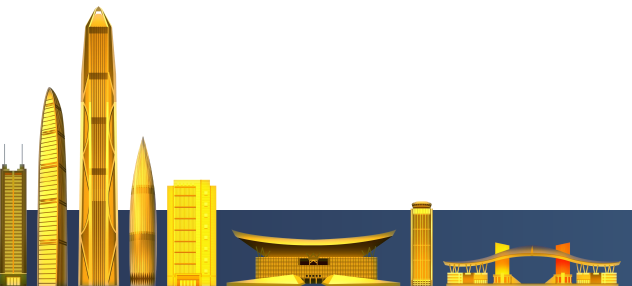

One renamed field, many broken flows

Literal.

Schemas map syntax, not meaning

Slow.

Systems change faster than teams can rewire them

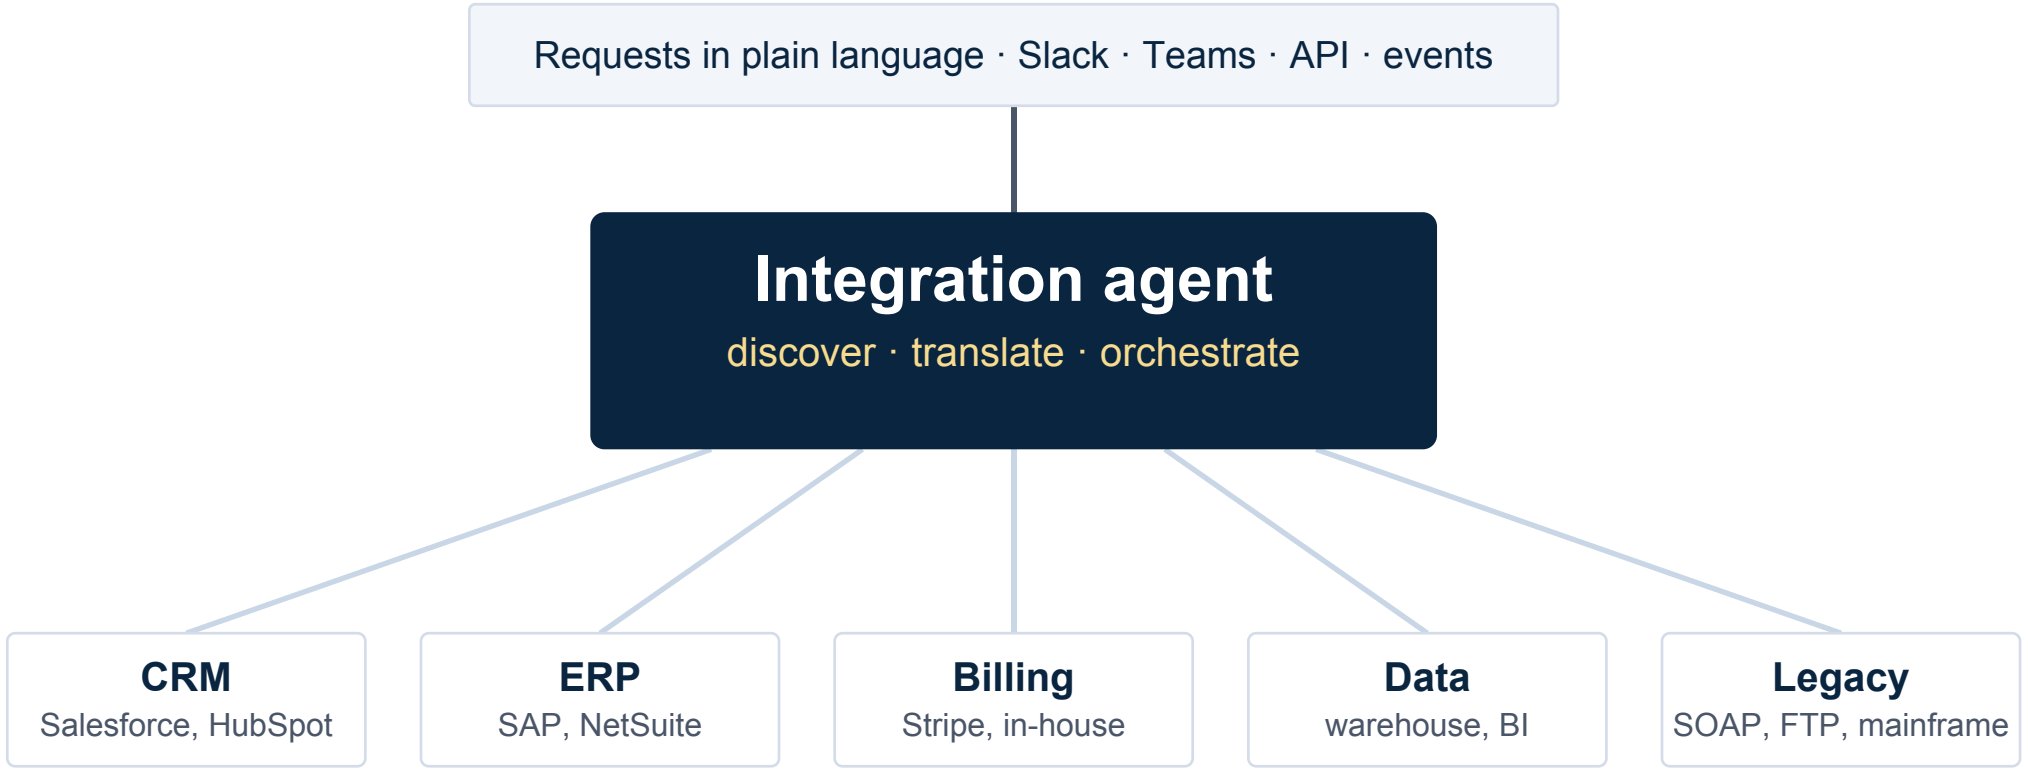

GOSIM

GOSIM Shenzhen 2026

What if the spider worked for you?

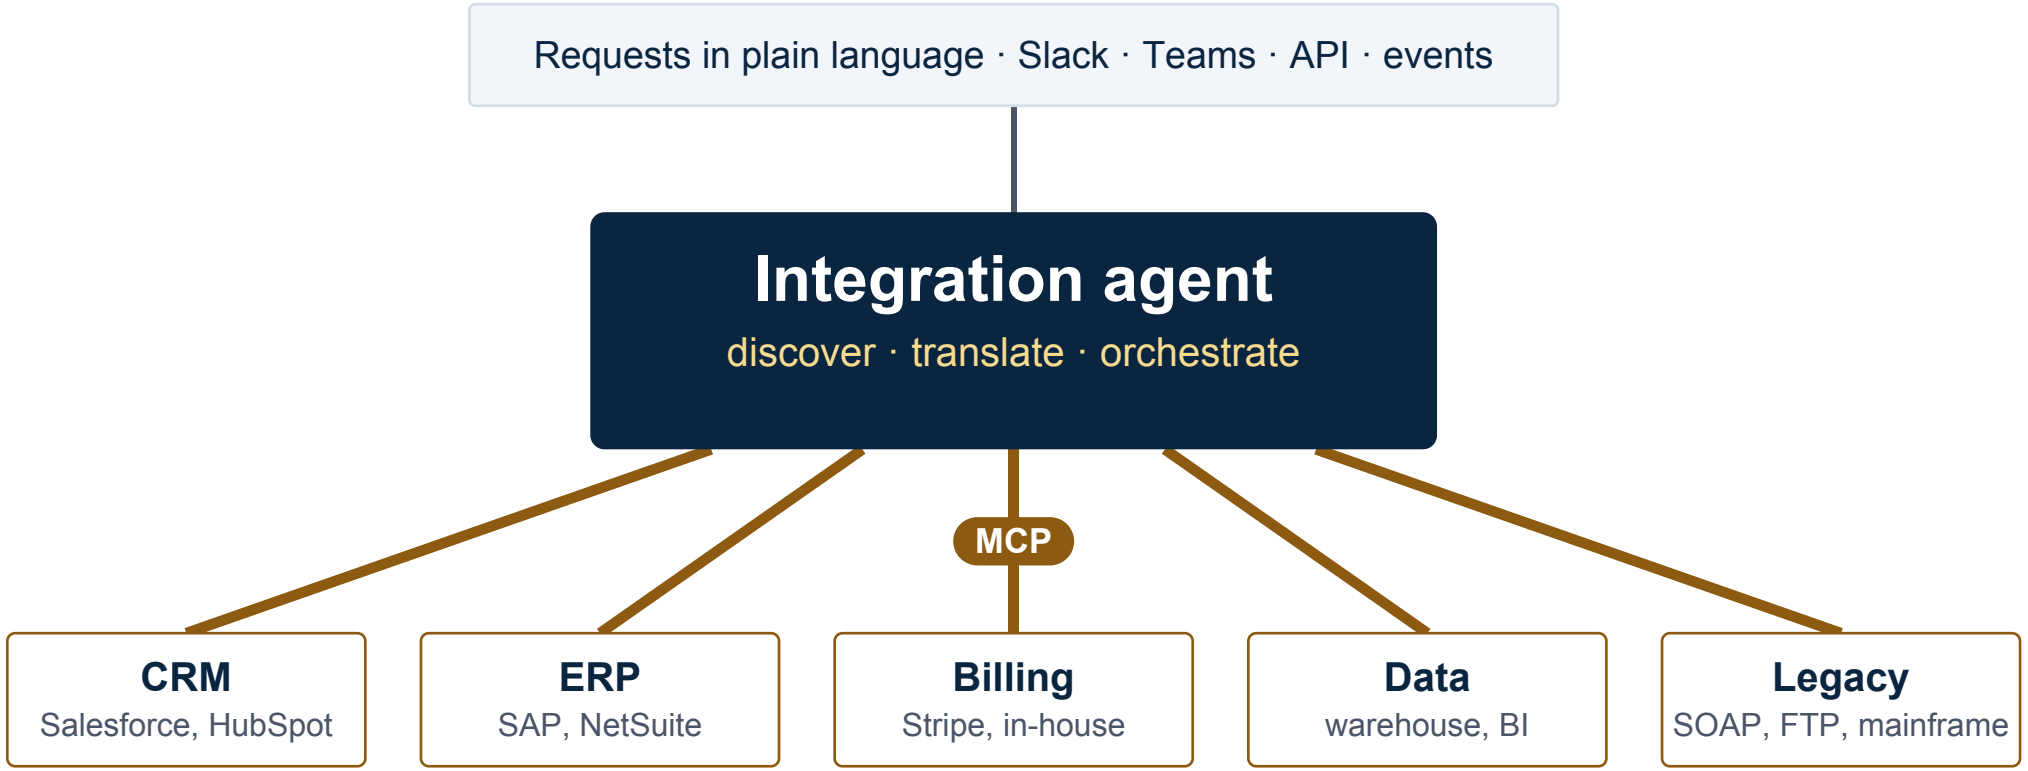

Put an agent in the middle

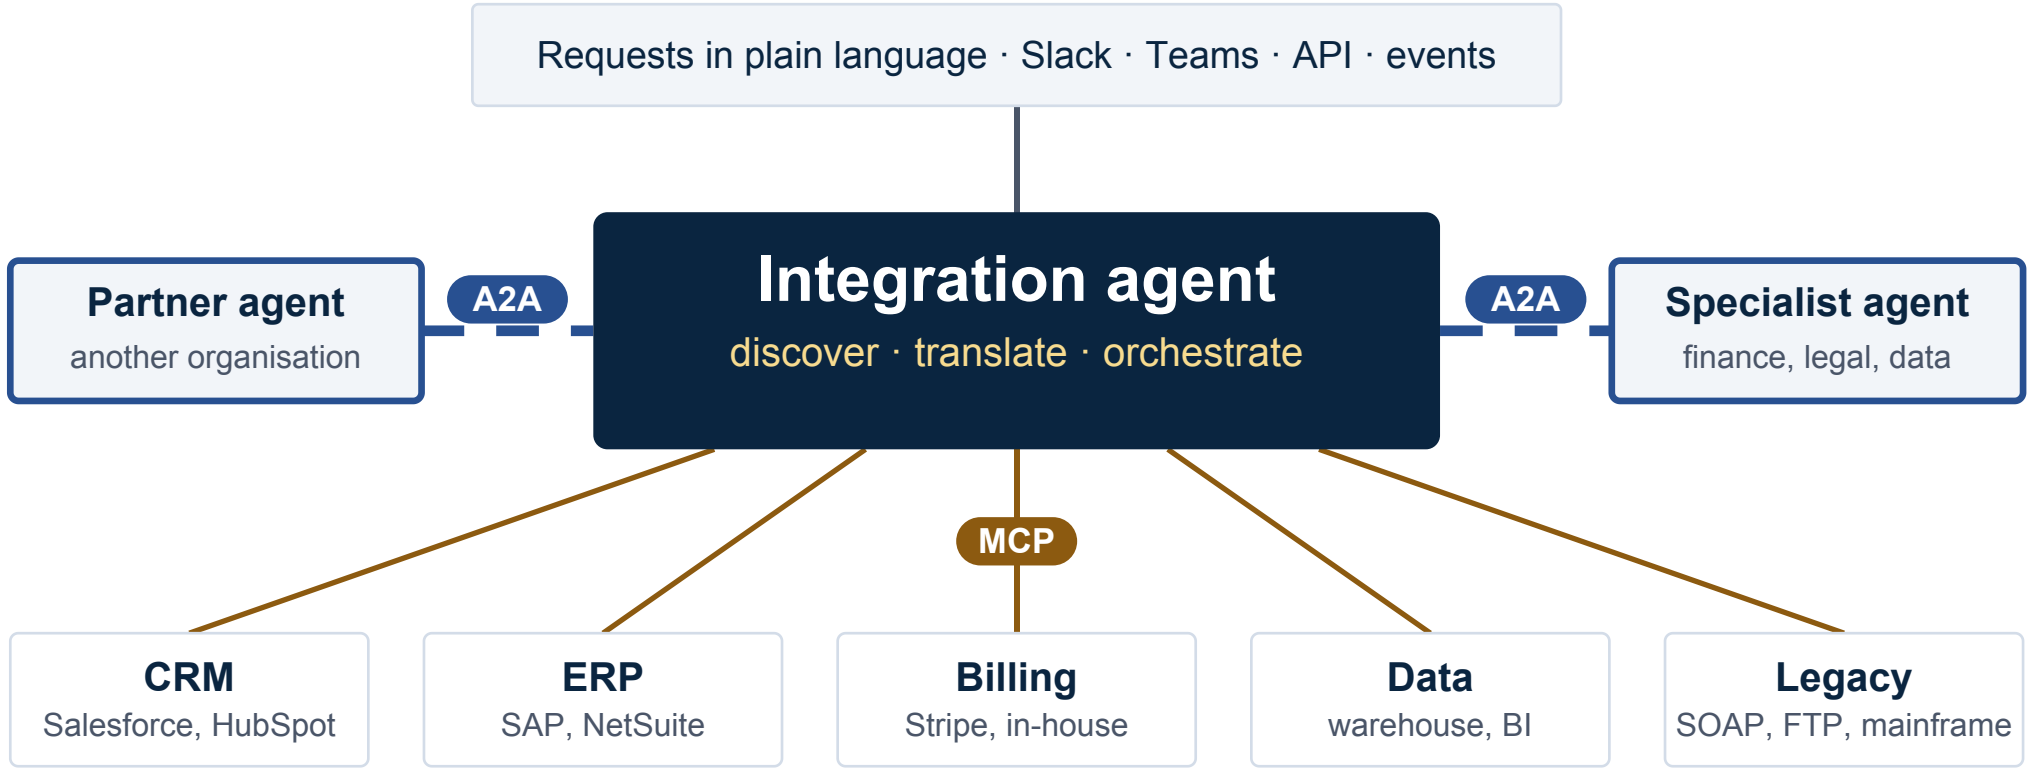

The APIs stay. The glue code goes.

It talks to your systems through MCP

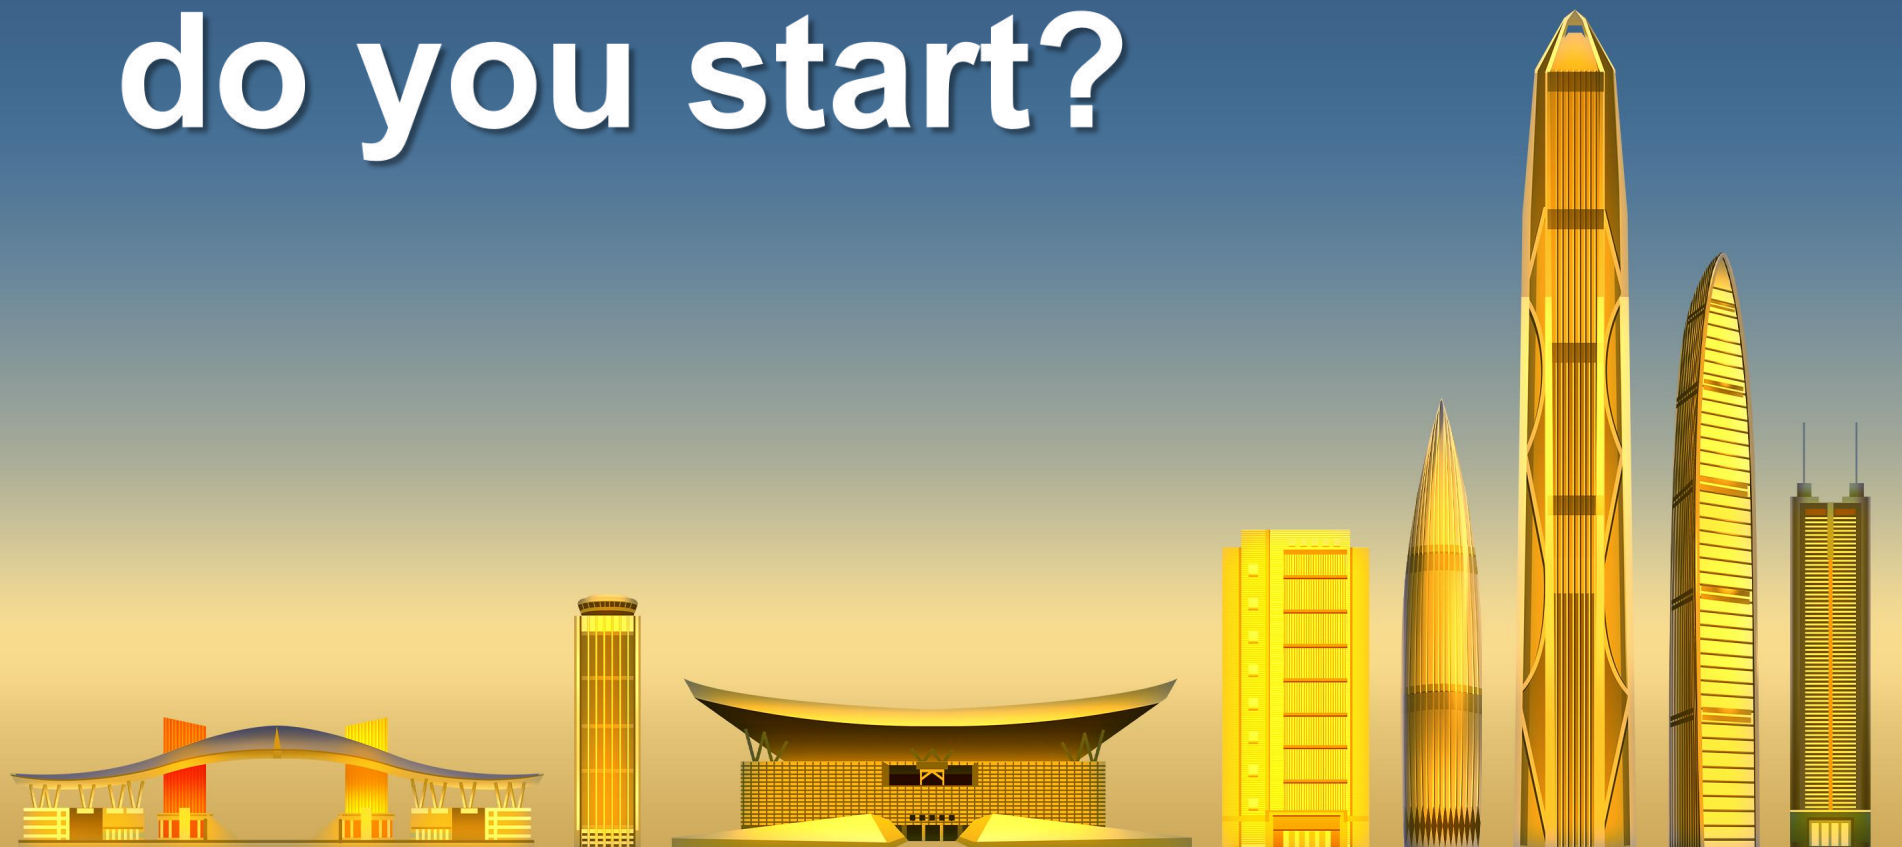

One standard plug for any tool or database Anthropic 2024 → Linux Foundation 2025

...and to other agents through A2A

Both open. No vendor owns the layer. A2A: Google 2025 → Linux Foundation

So where do you start?

The giants are opening their toolboxes

Salesforce

MuleSoft Agent Fabric: a control plane for agents, MCP and A2A

Microsoft

Copilot Studio and Azure AI Foundry speak MCP and A2A

Google

Created A2A, then handed it to the Linux Foundation

AWS

Bedrock AgentCore connects agents to tools and other agents

Alibaba Cloud

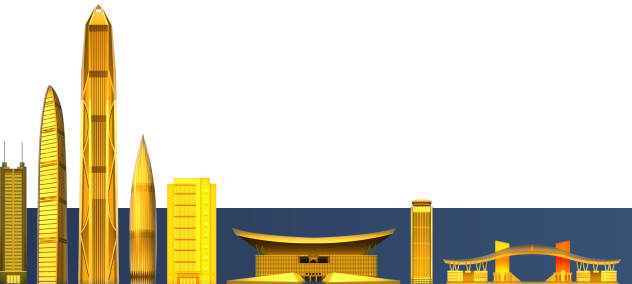

Bailian MCP Plaza: plug MCP services straight into agents

Zapier · Workato

9,000+ apps and 12,000+ connectors opened to agents

Every connector is becoming an agent tool.

Sources: MuleSoft, Microsoft, Google, AWS, Alibaba Cloud, Zapier, Workato documentation (2025–2026)

But no giant fits you perfectly

3 in 4

enterprises say losing their AI vendor would disrupt operations

64%

run three agent orchestration platforms at once

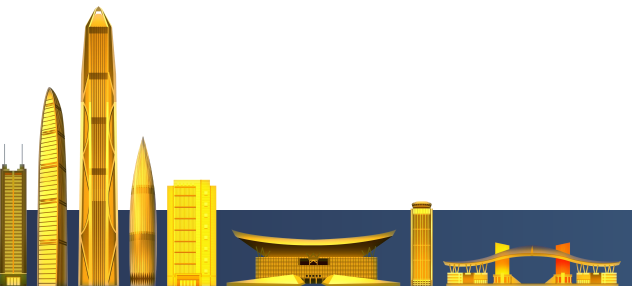

1 in 5

can't stop a runaway agent's spending in real time

Lock-in · one size for everyone · costs you can't steer

Built for everyone. Tailored to no one.

Sources: Zapier enterprise survey (2026); VentureBeat Pulse, 107 enterprises (Aug 2026)

GOSIM

Think only the giants are changing the game?

GOSIM

GOSIM Shenzhen 2026

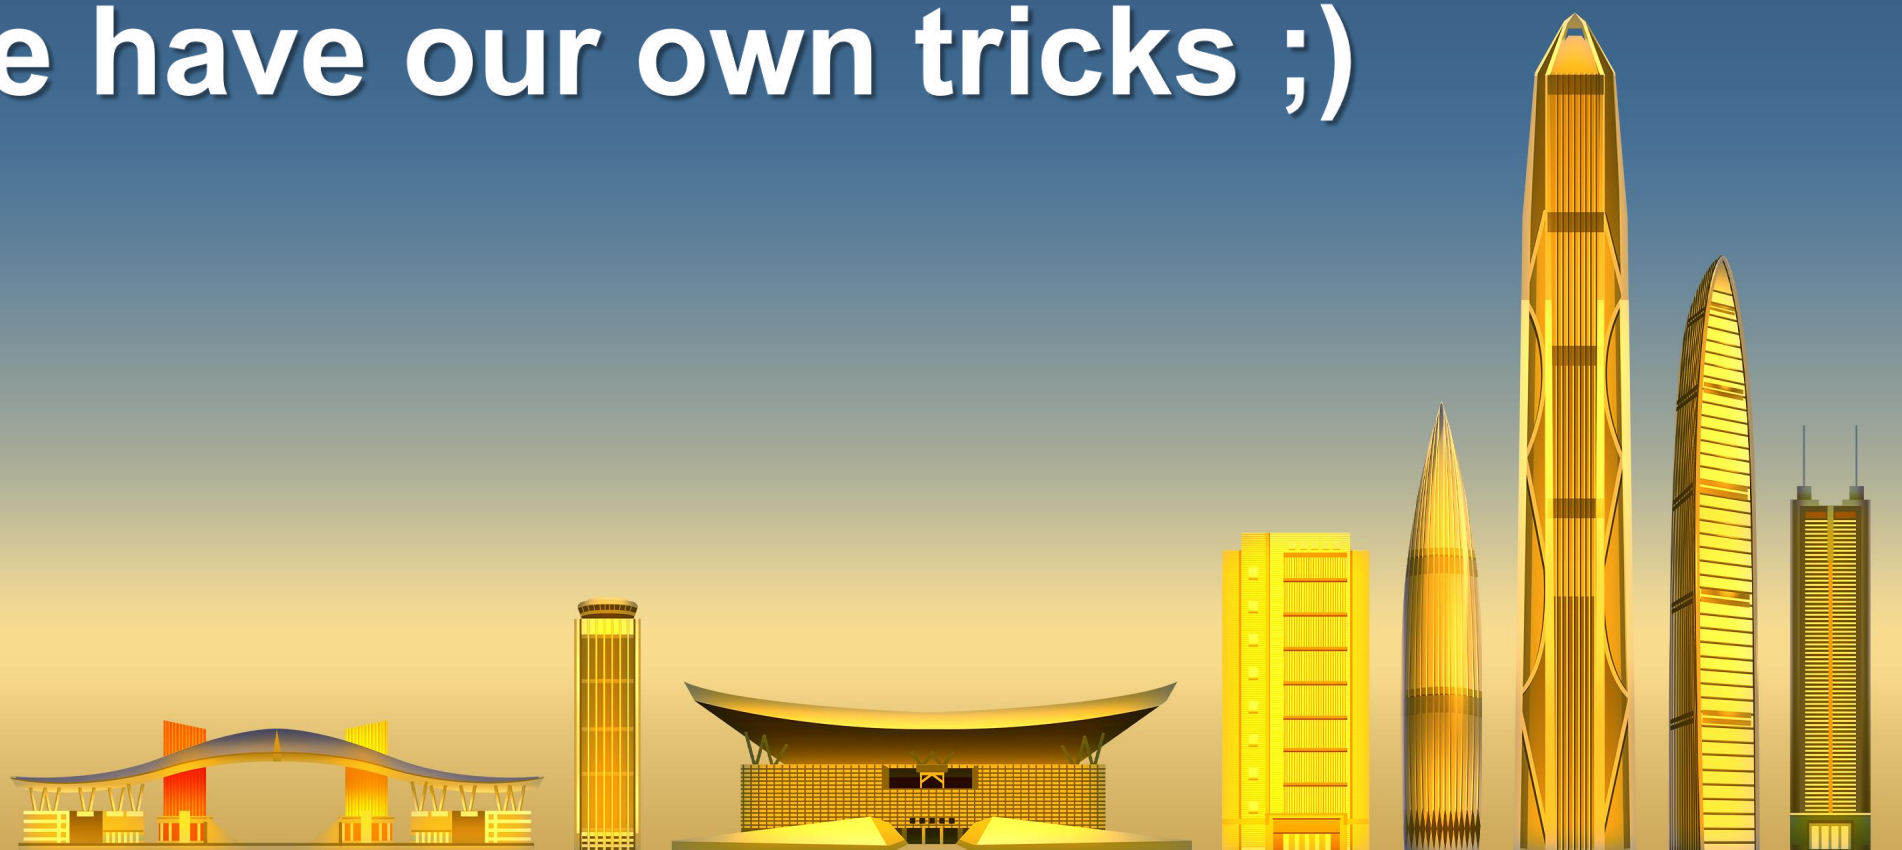

I'm Polish.

GOSIM

GOSIM Shenzhen 2026

You know us Polish people... we have our own tricks ;)

GOSIM

GOSIM Shenzhen 2026

What would you do with an army of curious, proactive juniors who never sleep?

Case study · Office: Viktor

marketing · Slack

Marketing team

@Viktor can you review our Meta Ads setup?

Viktor

Checked campaigns, budgets and reports. Found a setting change worth ~$10k a week.

Illustration of a real case described by the founder (Fortune, 2026)

Skills on demand

Loads only the integration knowledge this task needs

Learns every API once

What it figures out, and every correction, is saved and reused

3,000+ tools, one conversation

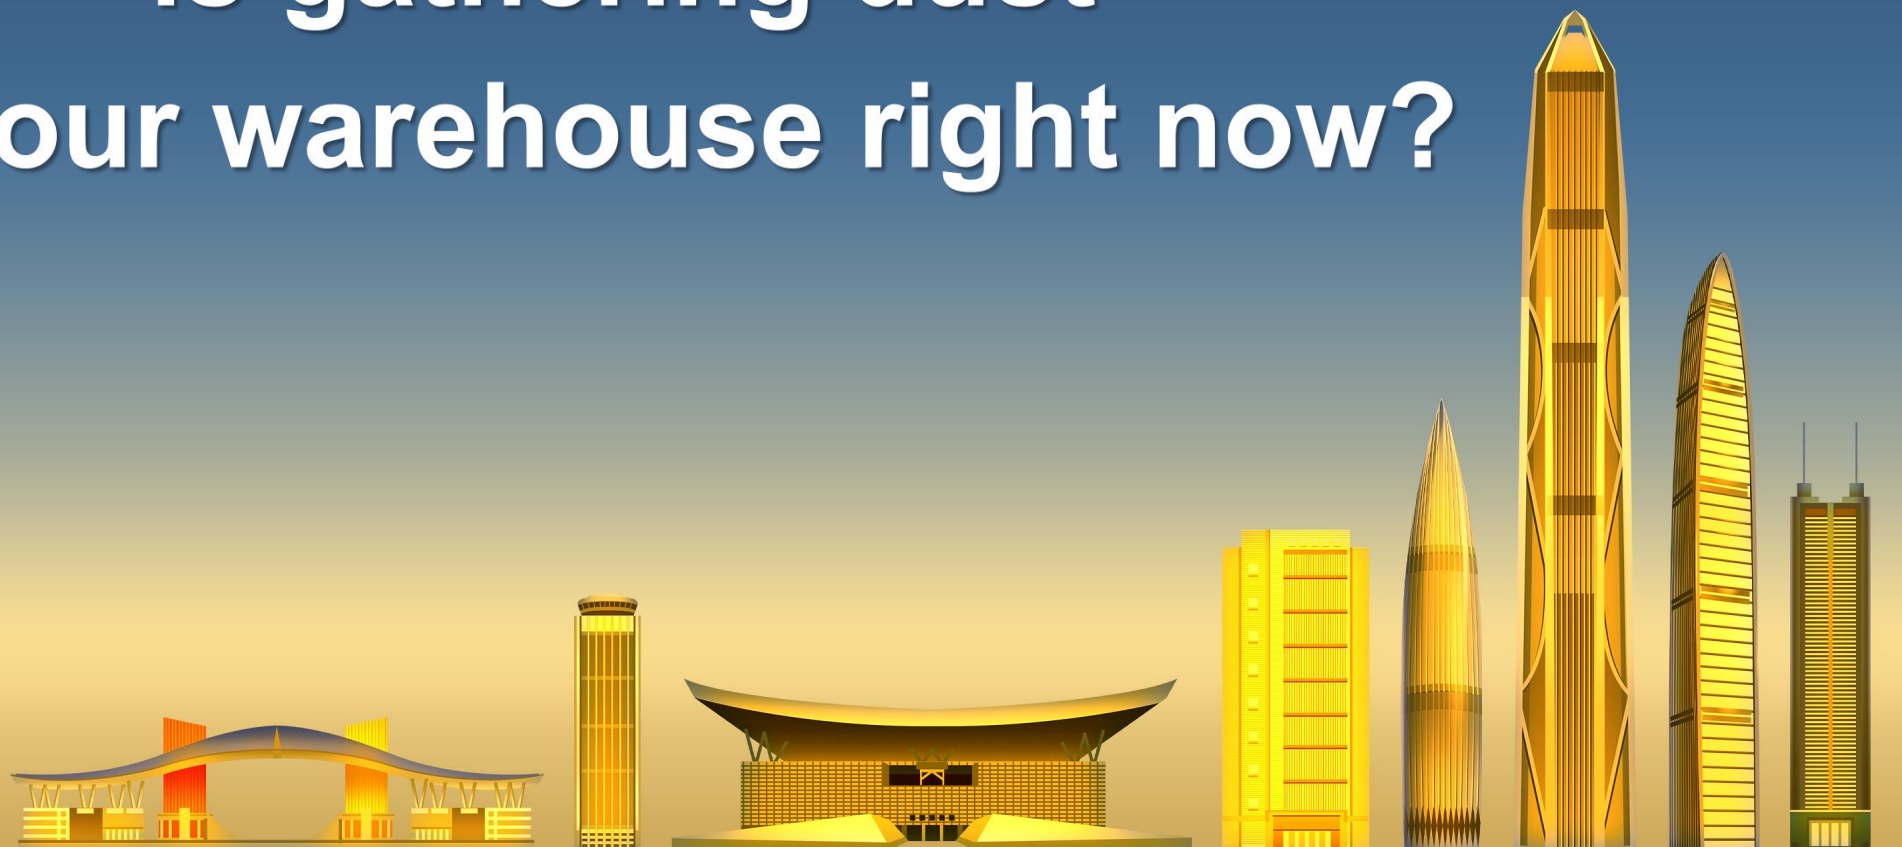

No integration project for the user

GOSIM

GOSIM Shenzhen 2026

How much money is gathering dust in your warehouse right now?

Case study · Industry: DeadStock

Helps factories sell surplus stock: agents turn messy factory records into ready-to-sell marketplace offers.

FACTORY RECORD · EXAMPLE

```
TAP-0412
Bsn mxr dk chr crt35
40 SET
```

No photo · no category · internal unit

Made for the warehouse, not a buyer

AI AGENT LAYER

1 Read
2 Identify
3 Enrich
4 Publish

A human approves before anything goes live

MARKETPLACE OFFER · EXAMPLE

Basin mixer tap
Chrome finish
35 mm cartridge
Bathroom › Taps
Qty: 40 pieces

Photo + specs added automatically

Connect once

5 ERPs + 4 marketplaces: 9 connections, not 20

Understands meaning

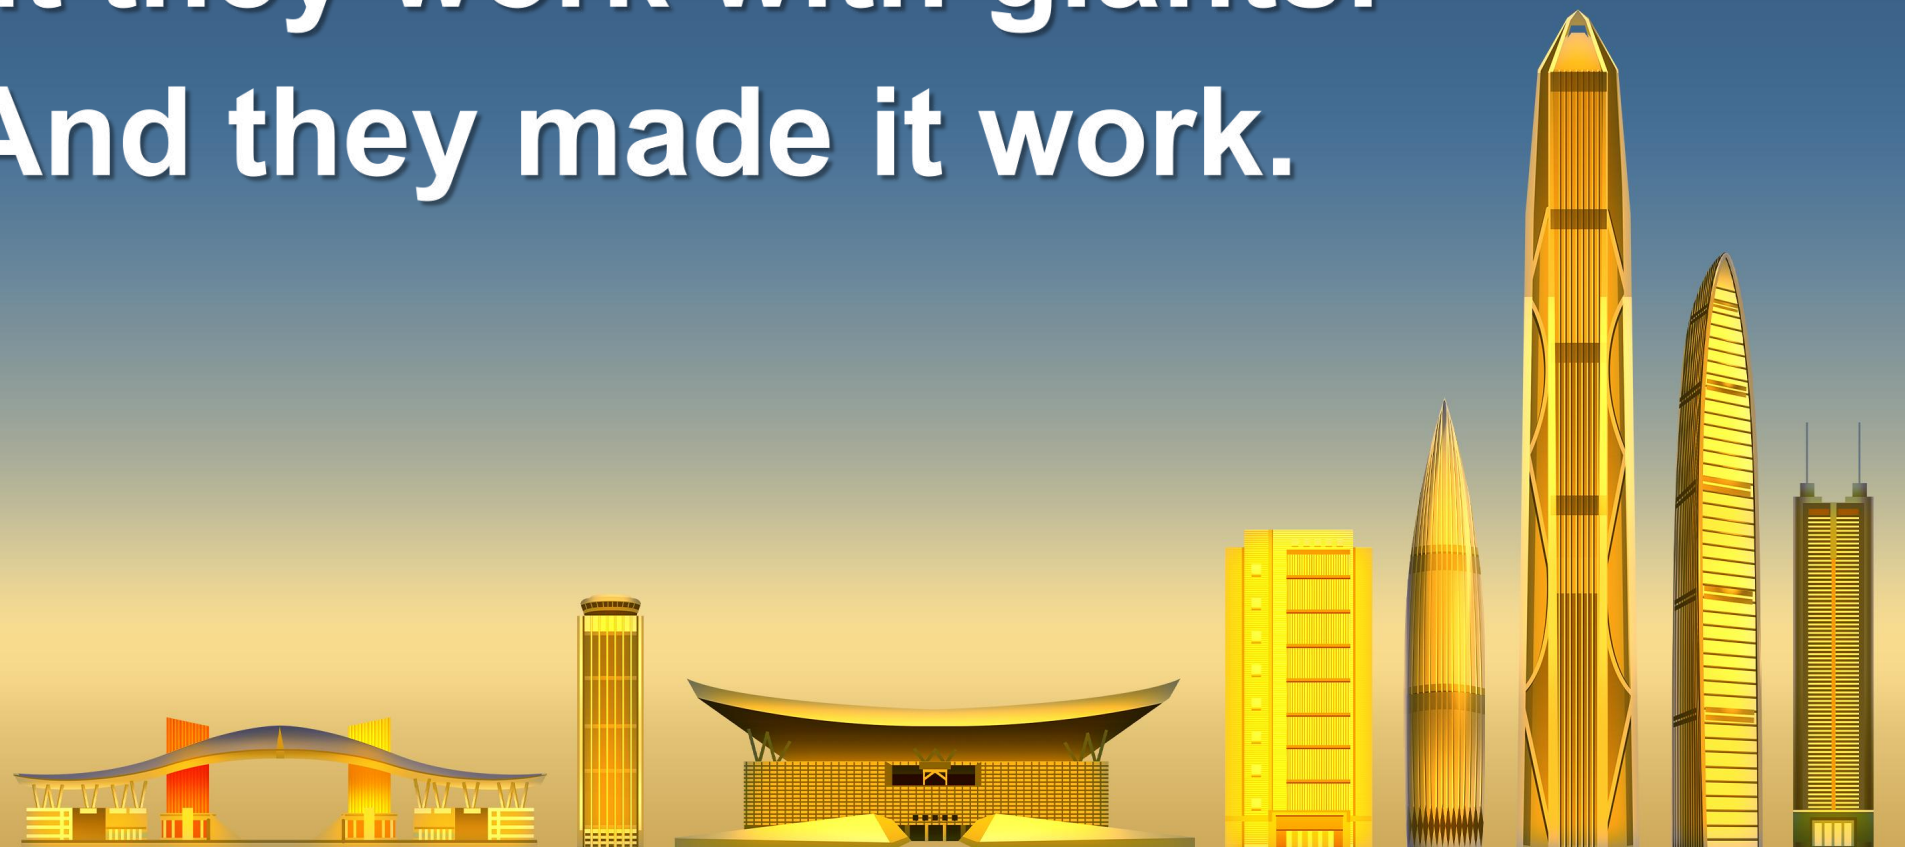

Reads abbreviations, units, old part numbers

People stay in control

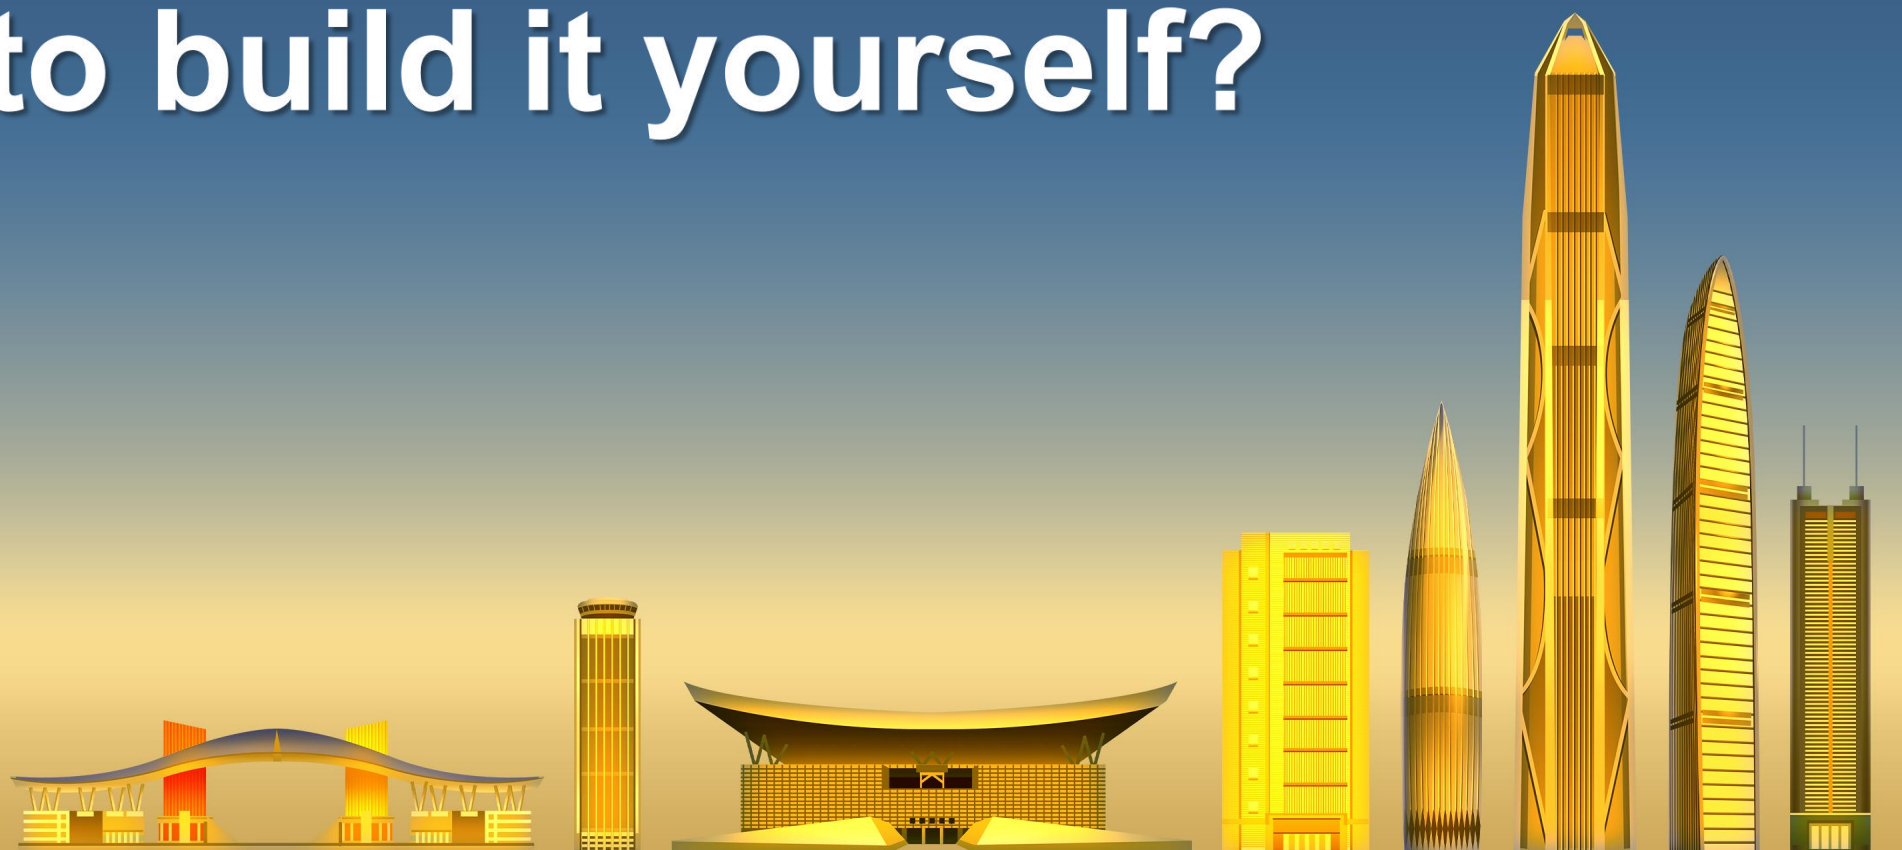

Every human correction becomes a permanent rule

Live at a modular-bathroom factory in Poland

They're small,
but they work with giants.
And they made it work.

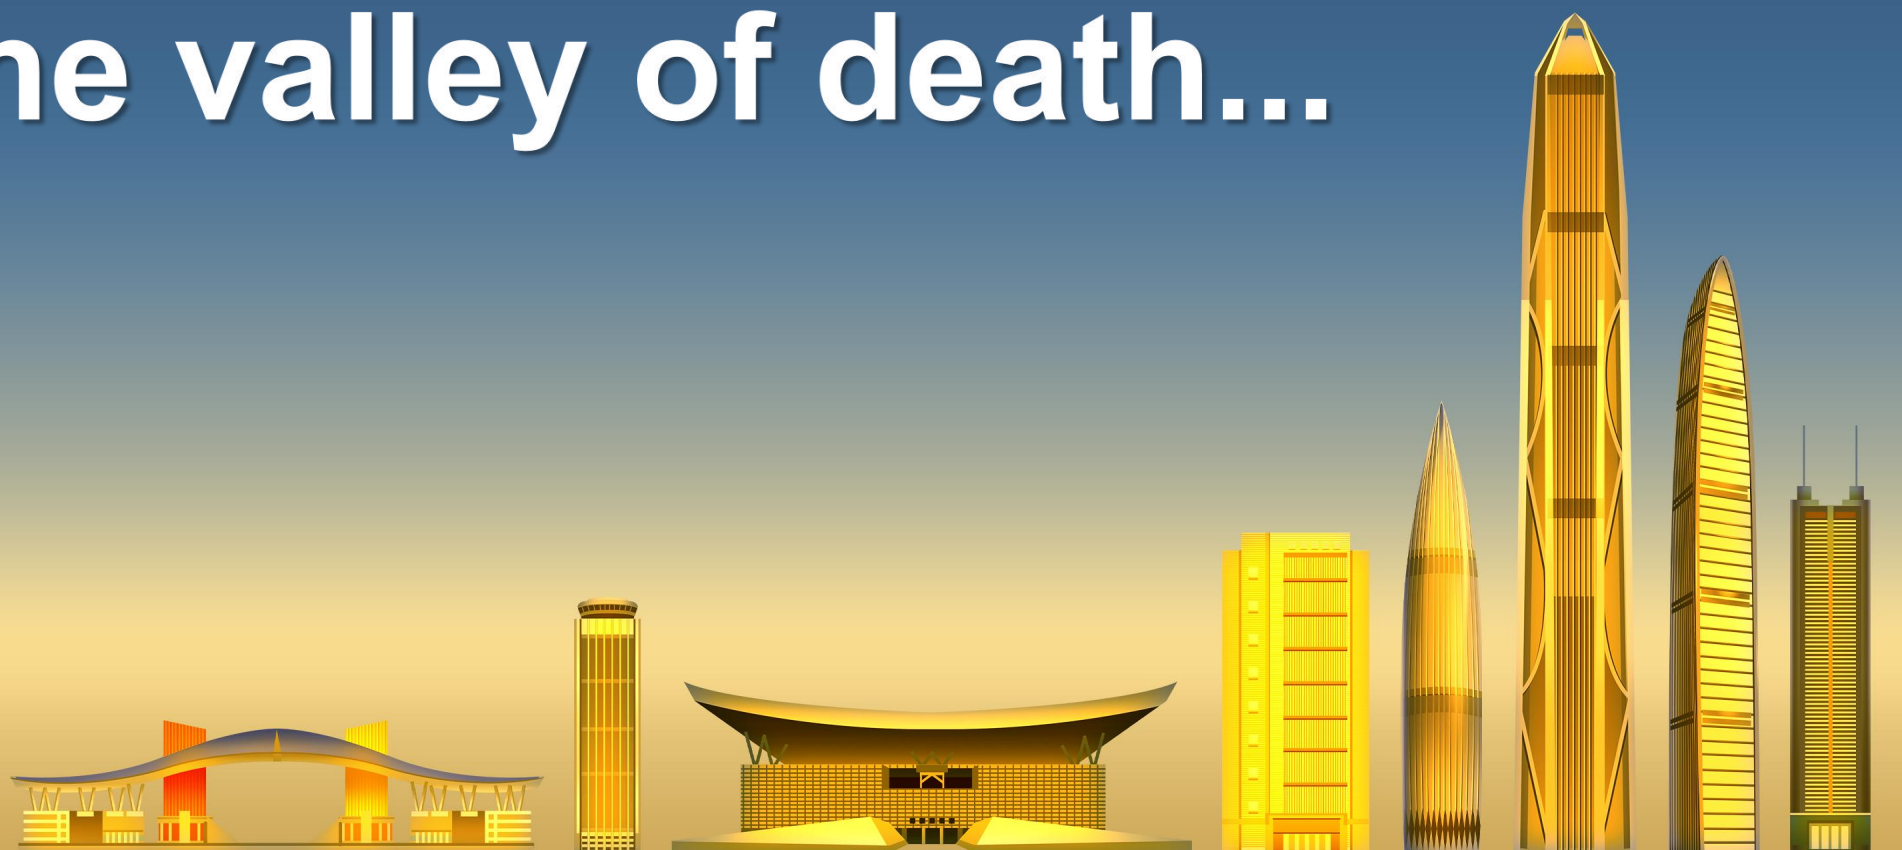

But what if you want to build it yourself?

GOSIM

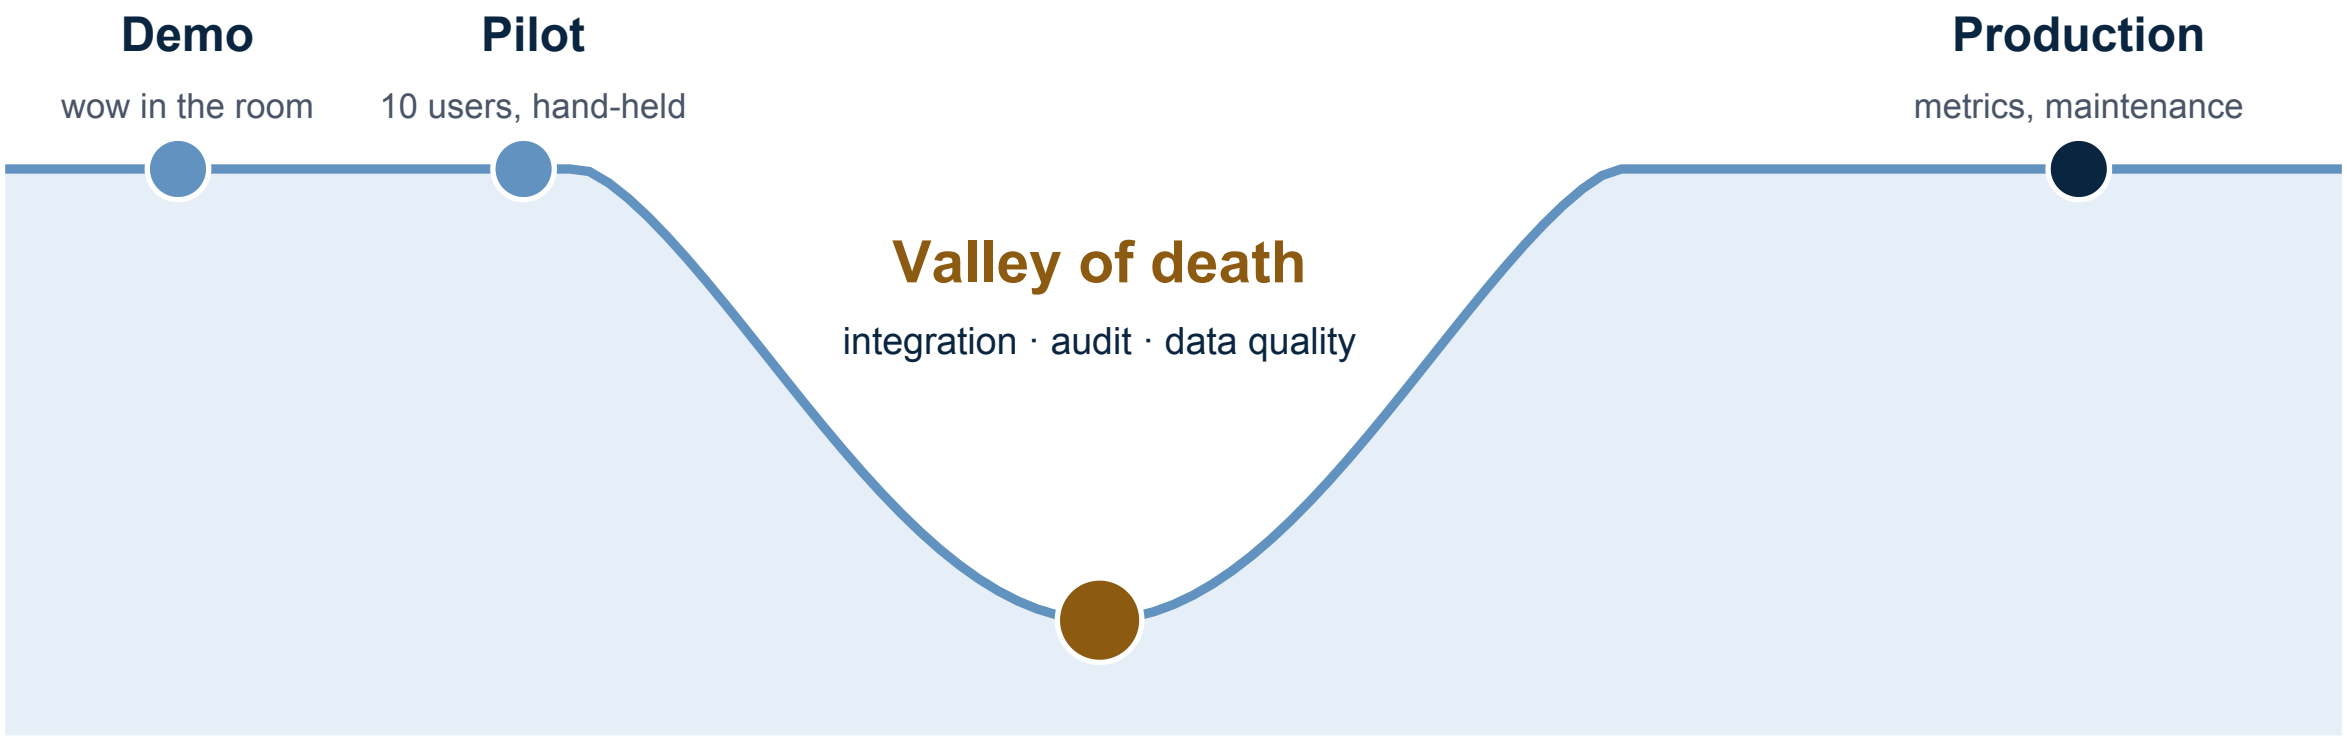

GOSIM Shenzhen 2026

Get ready to cross the valley of death...

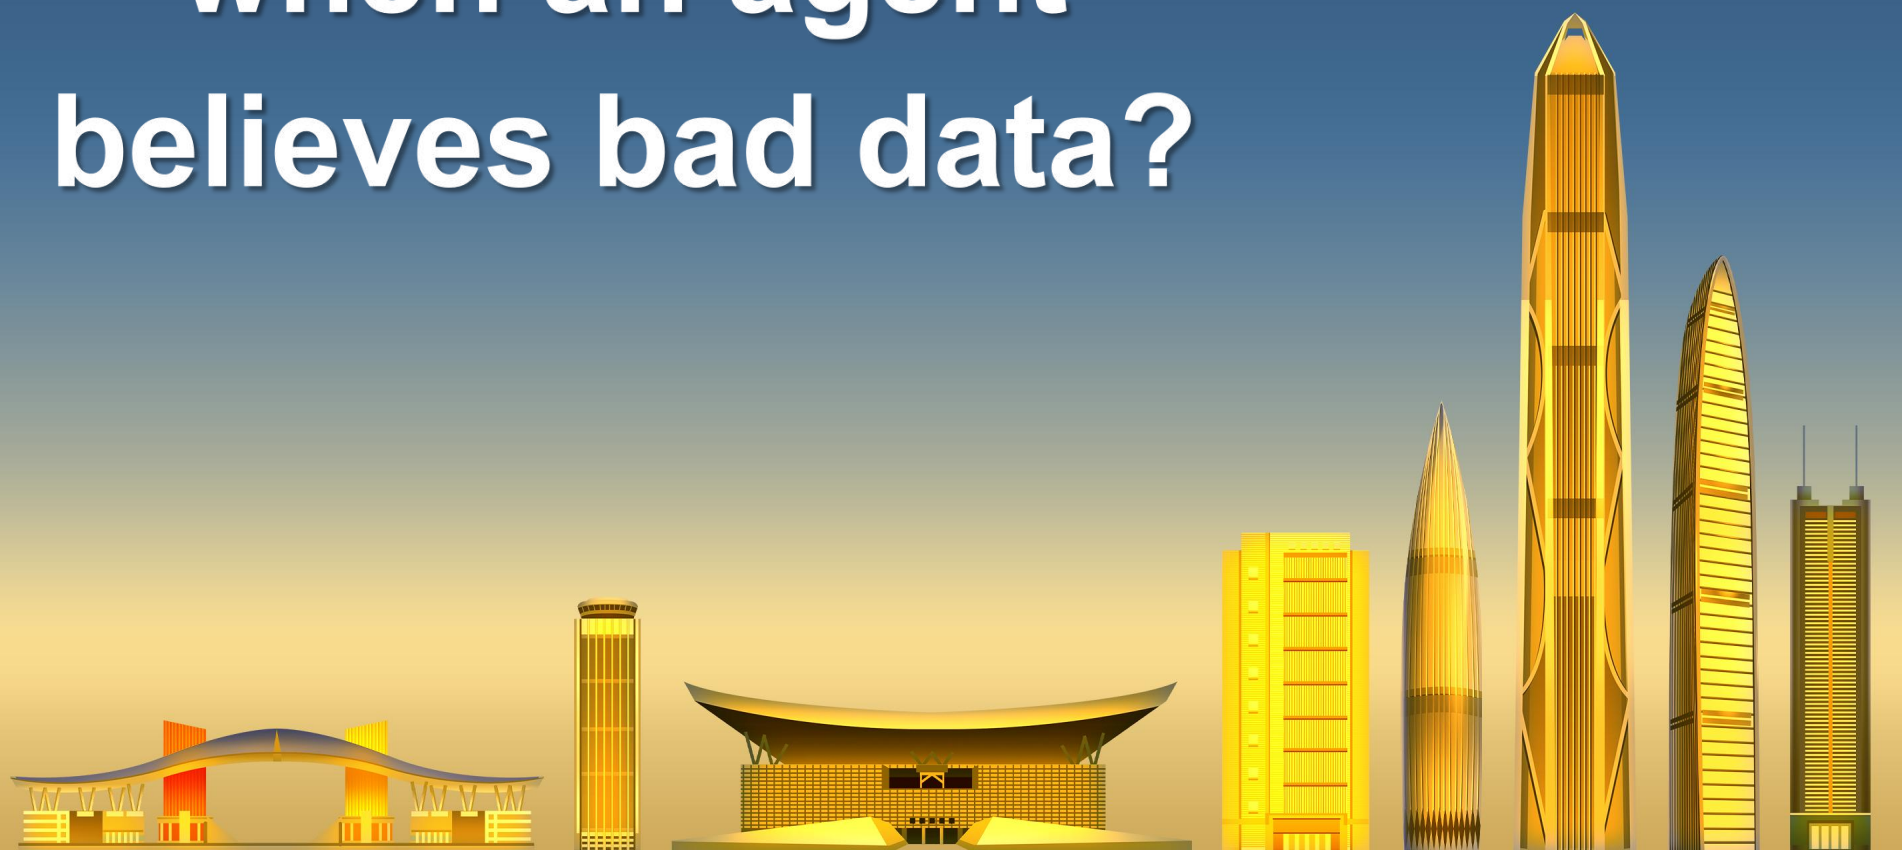

They die in integration.

Pilot on a slide. Staircase in production.

What happens when an agent believes bad data?

Agents amplify data quality, good or bad

4×

more invested in data quality and governance where AI succeeds

65%

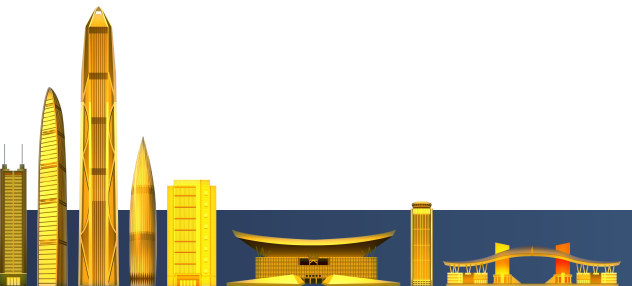

greater business outcomes for the most AI-ready data organisations

Silent

An ESB fails loudly on a bad record. An agent acts on it.

Data quality becomes action quality.

Source: Gartner press release, 16 Apr 2026 (survey of 353 D&A and AI leaders, Nov–Dec 2025)

Data quality guardrails for agents

Source
as is

→

Data contract
schema, units, owner

→

Quality gate
complete, valid, fresh

→

Agent
translates, decides

→

Action
write, notify

Lineage and provenance at every step

Contracts per tool

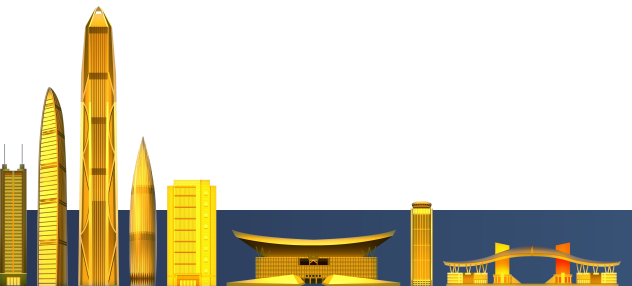

in the MCP tool schema

Gate fails?

agent stops or asks a human

FAIR metadata

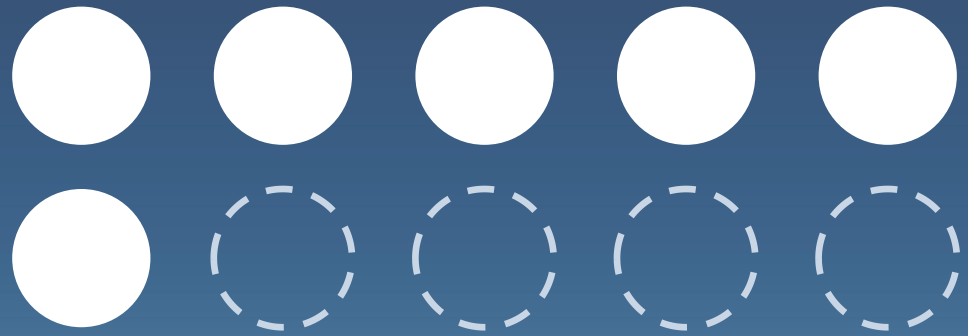

findable, accessible, interoperable, reusable

GOSIM

GOSIM Shenzhen 2026

Out of every ten agentic AI projects...

four won't survive 2027.

What can go wrong (and will)

Unpredictable.

Same request, different behaviour tomorrow

Exposed.

Every reachable tool is attack surface

Ungoverned.

Only 11% run agentic AI in production (Deloitte, 2026)

Expensive.

Reasoning costs more than a direct API call

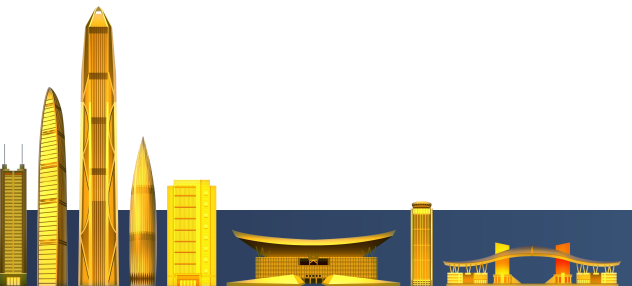

Sources: Gartner (June 2025); Deloitte Tech Trends 2026

Four questions before you add an agent

01	**Where is the data?**	And can the agent trust it?
02	**Who is the agent acting as?**	Own scoped identity, human approval for risk
03	**Can we switch vendors?**	Open protocols (MCP, A2A) beat lock-in
04	**Who owns the outcome?**	Where automation ends and a human decides

Can't answer all four? Don't plug the agent in yet.

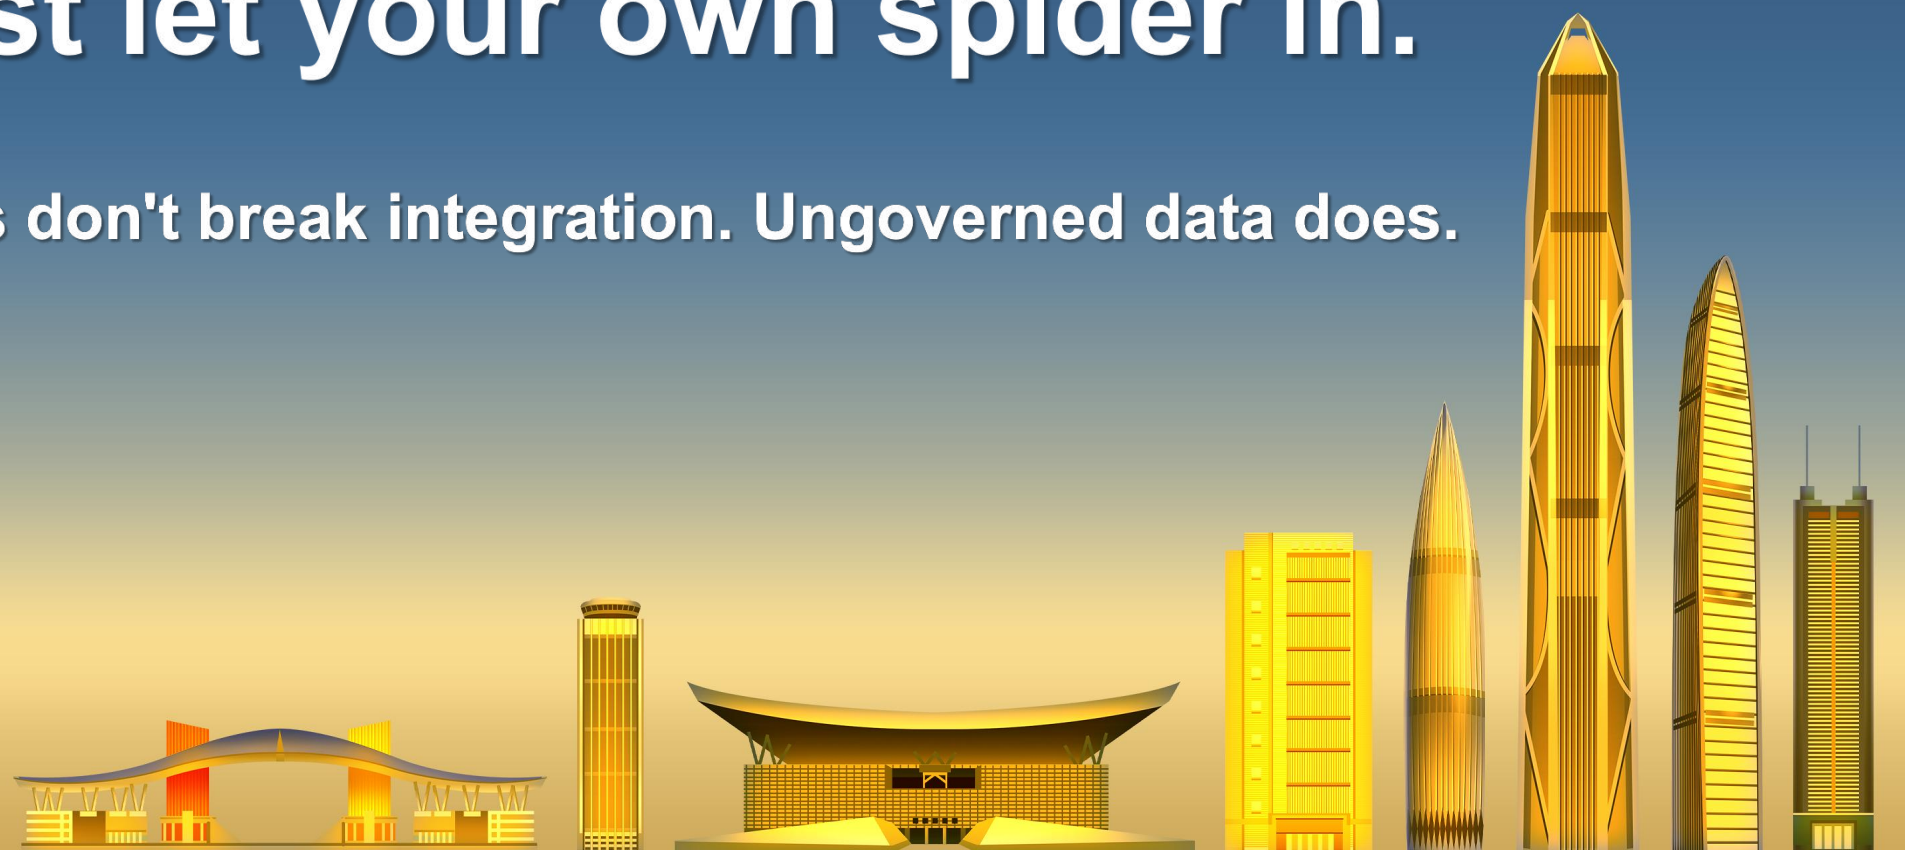

GOSIM

GOSIM Shenzhen 2026

You don't have to reweave the web. Just let your own spider in.

Agents don't break integration. Ungoverned data does.
