GOSIM

The FuriOS Approach: AI That Knows Your Hardware

Agentic development for mobile Linux that actually compiles, installs, and runs.

GOSIM Shenzhen 2026

October 16-17, 2026 Shenzhen, China

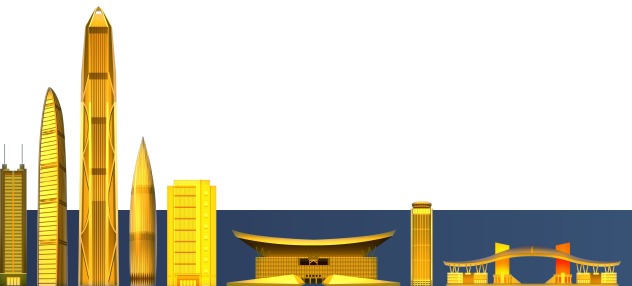

Kickoff & Build Started

- Starting the build now - 13-15 minute compilation time
- While the app builds, we'll walk through what FuriOS-App Skill does and doesn't do
- Real-time demo: you'll see finished, working prototypes before we leave this slide deck
- Two apps building today. First one is live. Second one launching mid-presentation.
- Four FLX1s phones being given away at the end

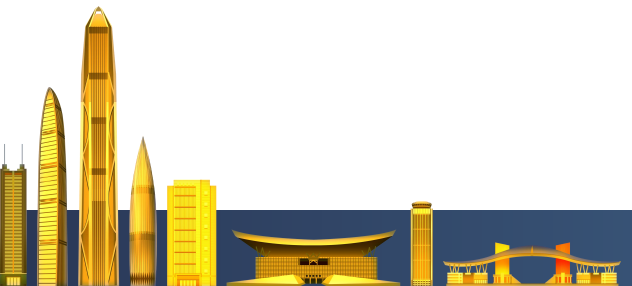

FuriOS-App Skill: What It Does

- Full phone architecture mapping (hardware, FuriOS, Debian, and the userspace stack)
- Functional app building from natural language prompts
- Debug capabilities across various userspace layers
- Hardware API access - camera, mic, GPS, storage, sensors
- Icon generation and home-screen integration

What You Get

- Working proof-of-concept applications
- App icon on your home screen
- Native GTK4/libadwaita interface
- Faster development iteration than writing everything by hand

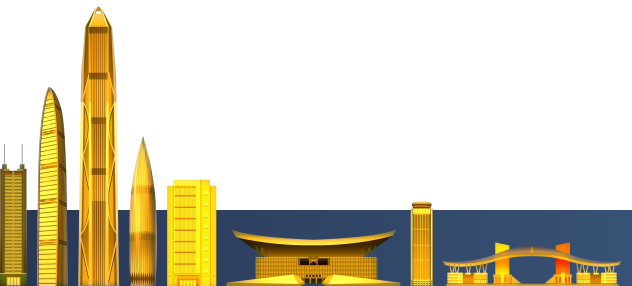

Development Approach

- Built to handle real FuriOS constraints
- Architecture-aware LLM code generation
- Produces working prototypes that need human review before distribution

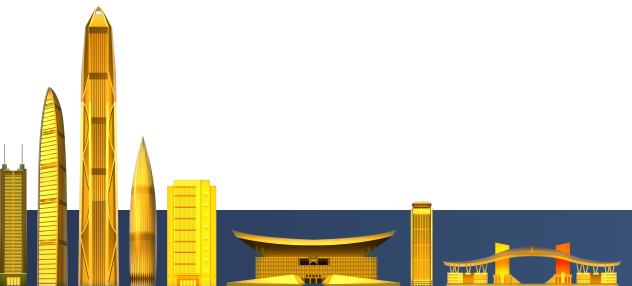

Live App Showcase: App #1

- Flick through the interface
- Show functionality end-to-end
- Running on actual FLX1s hardware

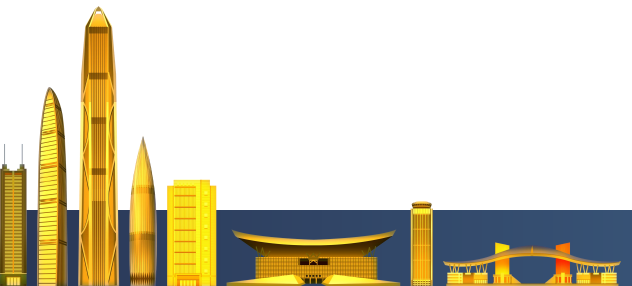

App #2: Build in Progress

- Real-time build of a second app
- Demonstrates the speed of the workflow
- Shows the skill attempts to handle real-world requests

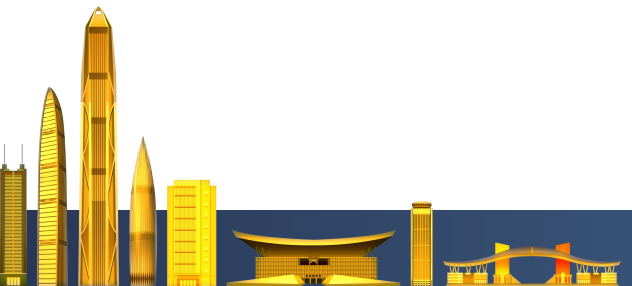

The Result

- Both apps running live
- Both built from simple natural language prompts
- Working prototypes, not production code

Before Shipping Any Code

- Have a human review the generated code - non-negotiable
- AI-generated code is scraped from thousands of repositories with different licenses
- You must review and modify the codebase to ensure legal distribution
- Without human review, you may be violating upstream software licenses

Distribution & Ownership

- You built it. You own it. Distribute how you like - but only after proper review
- Personal/internal use can skip some steps. Public distribution cannot.

Find the FuriOS-App Skill

- The FuriOS-App Skill lives at furi.ai, with demos and AI tools for the ecosystem

Giveaway & Closing

- Interest, engagement, questions during Q&A
- Audience that wants to build their own apps
- Questions?
- (Phones awarded to Q&A participants)
