October 16-17, 2026 Shenzhen, China

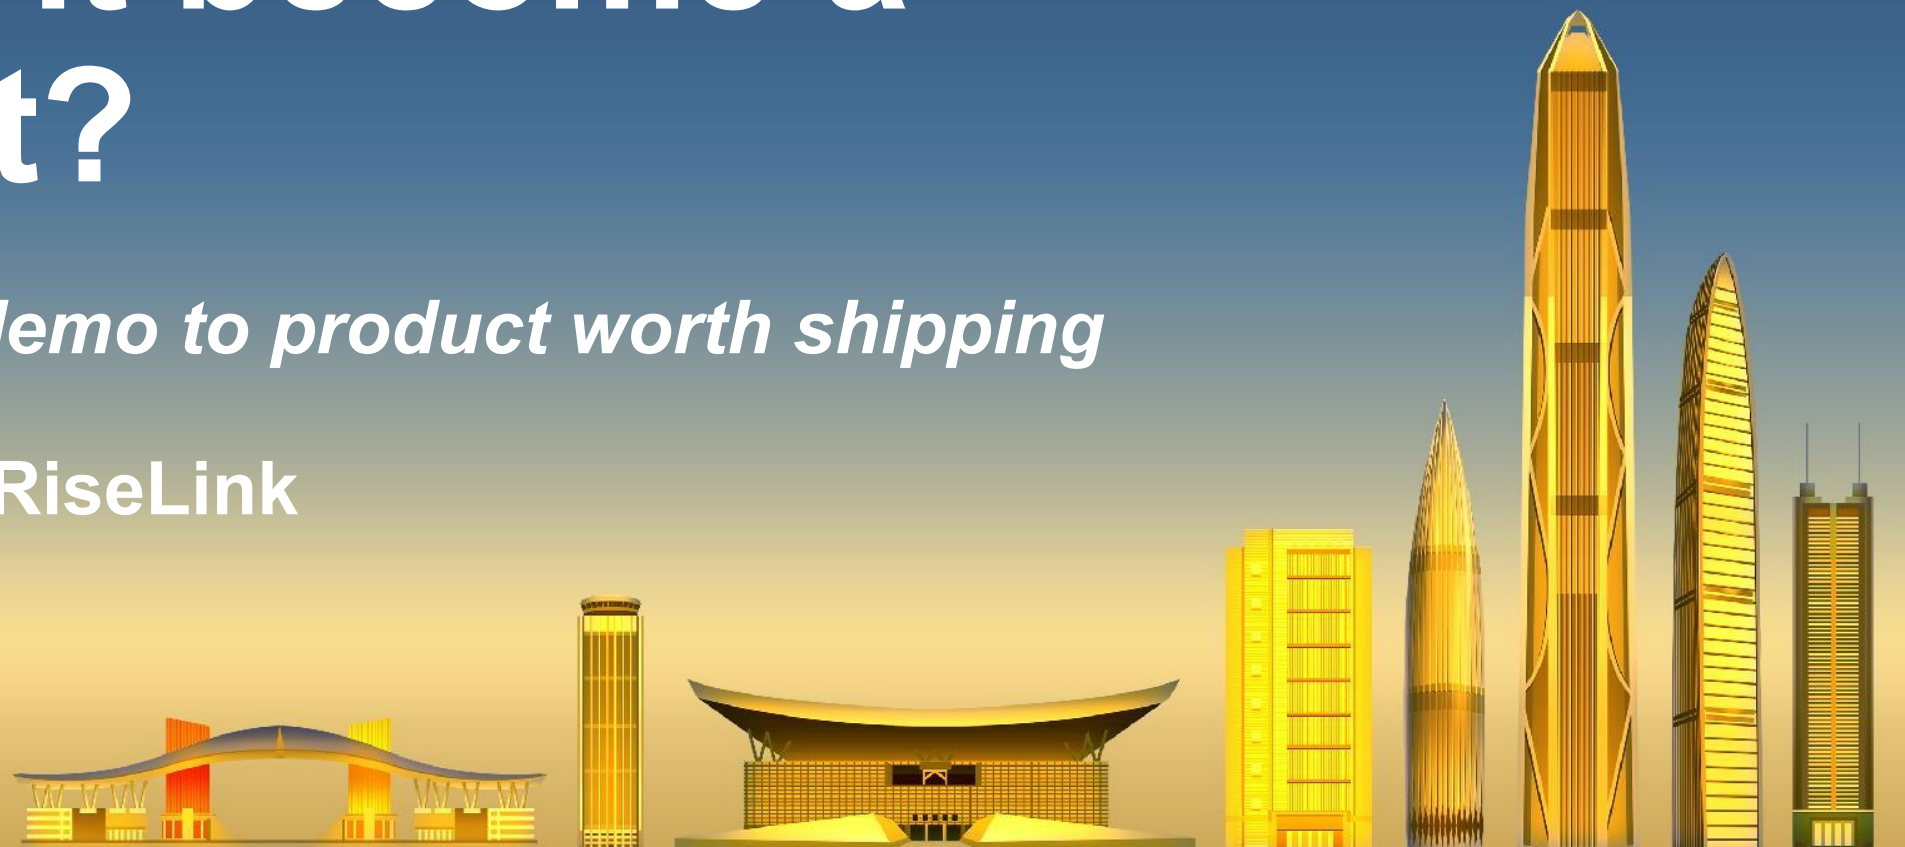

GOSIM

GOSIM Shenzhen 2026

You built the prototype. Should it become a product?

From working demo to product worth shipping

Tess Kassier – RiseLink

CONTENTS

1 Find the product and moment of value

2 Design the system around it

3 Prove it can survive production

GOSIM

GOSIM Shenzhen 2026

01

Find the product

What is the moment of value?

A good demo can answer the wrong question.

√ The model works
√ The hardware works
√ People like the demo

But do you know what the user actually values most?

People may like a demo because it is **novel**.
A product has to survive use.

Start with the moment of value

The interaction should generate the engineering requirements —
not the other way around.

TRIGGER
someone says something

→

PERCEIVE
camera / mic / sensor

→

UNDERSTAND
classify / infer / reason

→

ACT
display / speak / move

→

FEEDBACK
user sees it worked

What has to feel instant?
What must work every time?
What can fail gracefully?

02

Design the system

Not every constraint matters equally. Find the 2-3 that choose the architecture.

SMART GLASSES

Power ↑ / Form factor ↑ / Thermal ↑

AI TOY

Power ↓ / Latency ↑ / Connectivity ↑

Architecture follows the experience.

Put each interaction where its constraints make sense.

DEVICE	CLOUD / LARGER COMPUTE	DEVICE
wake / event detection bounded recognition real-time control	richer understanding reasoning	respond act feedback

wake word

large-model understanding

device playback

03

Prove it can survive production

Reality attacks the prototype

Production removes the assumptions that made the demo easy.

Prototype	Product
Plugged in Known Wi-Fi Dev board Happy path Developer nearby	Battery Real connectivity Real enclosure Long-tail behavior Nobody nearby

“Can the device connect and stream audio?”

“Can it connect, stay connected, recover from interruptions, and maintain acceptable power consumption across real-world networks?”

Smart lock: local AI + 1080p two-way A/V + connectivity + <100μA standby

Camera: always-on video mode at 5mW; standby <100μA

Don’t productize everything you prototyped.

The best product may be the one that **ships with less.**

Prototype asks:

What can we add?

voice | vision | gesture | cloud

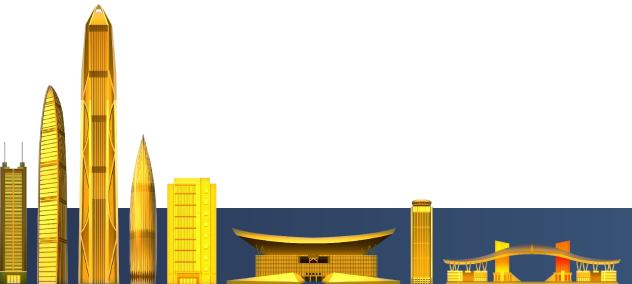

app | lights | motor | display

Product asks:

What can we remove?

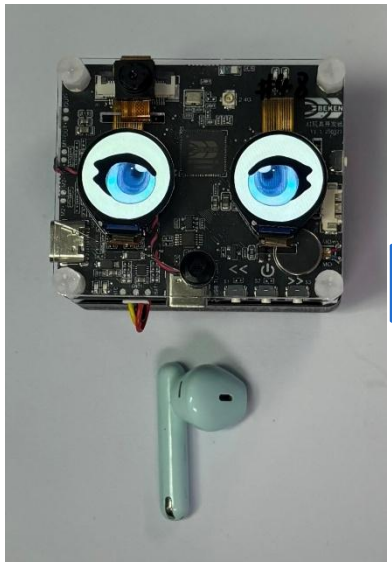

smallest reliable system that delivers the valued experience

Every extra feature adds: power | compute | UI | testing | support | failure modes

Don’t productize everything you prototyped.

The best product may be the one that ships with less.

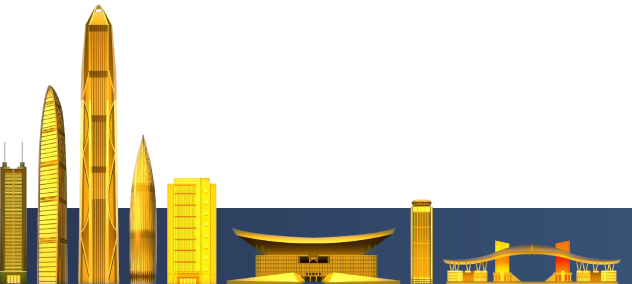

Two days of effort

Two+ months of effort

Before you productize the prototype, answer:

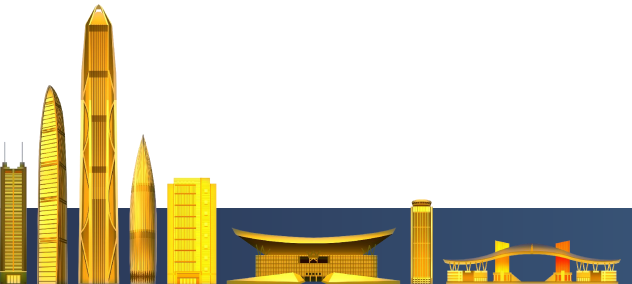

EXPERIENCE	ARCHITECTURE	PRODUCTION
What is the end-to-end latency budget, and what dominates the tail?	What is always on, what wakes up, and what does one useful interaction cost in energy?	Which edge cases become expensive at 100,000 devices?
What happens when connectivity disappears or degrades?	Which inference stages truly need to run locally?	How will you diagnose a failed interaction in the field?
	What workload determines compute + memory choice, not your best demo?	

Can we make it work? → **Is this the experience worth building?** → **What system can deliver it reliably?**

Don’t productize the demo.

Productize the **experience** — and the most refined system that can deliver it.
